

Chosen Stack: React + Vite

I chose React + Vite because it gives me the best balance between learning and building. I already have a good understanding of HTML, CSS, and JavaScript, but I know I still need to improve my React skills. Since one of the goals of this portfolio is to grow as a frontend developer, building it with React makes it a valuable learning opportunity. It also supports everything my portfolio needs, and I know I can maintain it as I continue adding new projects.

Not Chosen: HTML, CSS and Vanilla JavaScript

This would have been the simplest option, and I know I could build and maintain the portfolio with it. However, I wanted this project to help me learn something new rather than only use technologies I'm already comfortable with. Choosing React allows me to strengthen an important skill while still completing the portfolio.

Not Chosen: Next.js + TypeScript + Firebase

I didn't choose this stack because it's currently beyond my skill level. I don't know Next.js or TypeScript yet, so I would spend more time learning the technologies than actually building the portfolio. I want to focus on creating a polished project while gradually improving my React skills instead of taking on too much at once.

2) Will my portfolio need a backend?

According to ChatGPT, no I don't need a backend. I have also understood the reason for the aforementioned. Since all my portfolio site needs are static elements, nothing that it should "store", i dont need a backend. We don't need users to sign in or something like that. We dont need authentication. We don't need a database. So we don't need backend. Only thing which might require a backend is like the contact form, which they can fill out. For that I can use a third party which handles deployment, and all that. So yeah, I will be building without a backend but i am, actively working on learning backend
