

Workflow Run-

First, I gave my math lectures to Notebook LLM. Asked it to summarise the lecture notes in a structured manner so that chatGPT can create good notes and flashcards out of it.

The chatGPT prompts are below -

[Prompt 1](#)

[Prompt 2](#)

[Prompt 3](#)

[Prompt 4](#)

[Prompt 5](#)

Honest Failures-

I honestly do not think there were a lot of failures. Notebook LM was on-spot. But chatGPT messes up calculations, and also generates a formula which is different from the one in my lectures slides sometimes. I caught a few tho-

- oversimplified the definition of rank
- didn't distinguish REF from RREF
- skipped why free variables create infinitely many solutions

Time Accounting-

How much time it took me to do this manually (I made notes for the first one) ~ 1 hours + 10mins of setup time whereas here i got it in like less than 5 minutes. SO THE GAP IS HUGE $70\text{mins} - 5\text{mins} = 65\text{mins}$, so this is like a huge lifesaver when it comes to exams in college.
