

Yes I shipped the portfolio website, and I don't think I have a lot of doubts regarding it. It is quite a simple website, and because this was not entirely AI, and I wrote the code by myself too, there's not much to learn from AI.

Yes, one thing that AI implemented was that when we hover over the image, it goes slightly up, really smoothly. It doesn't go up with a jerk, it goes up smoothly. So I went through the code and read a little more documentation. Turns out, when we hover over the image, `translateY by 8px` has been applied. Also, a transition has been set for the smooth portion. That's one part I couldn't understand at first but after reading the docs I could understand it well.

Then I also tried experimenting with ease, ease-in-out transitions which were basically like I was just testing which one looked better, but honestly the first one looked better so I just kept it as it is, nothing more about it, it's a simple website that I made quite some time ago and I'm eventually getting better in creating animated websites using gsap now :)
